

Air traffic control for the OR suite.

GPS for the day of surgery.

Every day, your charge nurses and anesthesia leadership juggle the same impossible task: deploying staff, assigning rooms, managing breaks, handling reliefs, and adapting to changes — all while keeping cases moving and patients safe. They do it with whiteboards, spreadsheets, and group texts.

ORlogic Air Traffic Control gives your board runners a digital command center for day-of surgical suite management. Charge nurses spend hours a day on next-day and current-day assignments — ATC gives that time back.

Three screens. One workflow.

01 Staff deployment

The day before surgery, deploy your team across locations. See how many rooms each location is running, what staffing solutions are recommended, and assign people where they're needed. Split shifts across locations. Publish when you're ready.

02 Room assignments

At each location, assign staff to specific rooms and cases. See the full timeline of who is where and when. Track progress against staffing models. The system prevents conflicts automatically.

03 The board

Run the day. Start from published assignments and adapt in real time. Track breaks, relieve staff when shifts end, close rooms as cases finish. Every change is timestamped.

Real-time control, without the chaos

Drag & drop

Move staff to rooms, cases, and locations with intuitive drag interactions.

SMS to staff

Text room assignments and live updates directly to people — no group chats or whiteboard hunts.

Break tracking

Tied to shift profiles. See who needs relief and who can self-cover.

Alerts & announcements

Tag meetings, early-out requests, and messages to specific staff.

Timeline view

Cases and assignments side by side to identify coverage gaps at a glance.

Cross-location visibility

Deploy staff across your entire health system from one screen.

Start anywhere. Add what you need.

ORlogic connects directly to your EMR and existing scheduling system, and every component shares the same data. Use any of them independently or together. Start with Air Traffic Control and add others without re-implementation — same data, same logins, same interface.

Run the day, don't react to it.

Contact ORlogic for a 10-minute walkthrough.
